Description of application

The SunSpiro® sun spiral is made of fluorescent, weather-resistant PLEXIGLAS® that absorbs light on the surface and emits it in a directed manner via the edges. This makes for a strong lighting effect. The spirals glow very brightly especially in dull weather and in the twilight hours.

In winter, they add a touch of color to the garden, especially when snow lies on the SunSpiro® sun spirals, causing them to emit even more light – without any need for electricity or a solar module!
